

## **ABSTRACT**

Methods and systems for recovering data are disclosed herein. Desired  
5 data such as files, folders, and the like can be initially identified from a  
command line interface displayable within a display area of a data-processing  
system (e.g., a computer). The desired data can then be automatically saved in  
a memory location of the data-processing system, in response to identifying the  
desired data from the command line interface. The data can then be  
10 automatically recovered from the memory location of the data-processing  
system for display within the command line interface, if the desired data is  
inadvertently deleted.
